piechart

Pie or donut chart with legend — proportional wedges.

H1 2026 · 1,840 PERSON-HOURS

Where the planning quarter actually went.

Nearly half went to producing decks; the deciding itself was the smallest slice.

H1 2026 · 1,840 PERSON-HOURS

Where the engineering quarter actually went.

Wedges drawn proportionally; the toil-and-on-call slice is the one nobody put in the roadmap.

- Signal Intake build 46%
- Scoring policy work 22%
- Decision Log integration 18%
- Explaining the framework to stakeholders 9%
- Toil and on-call 5%

Where the planning quarter actually went.

Nearly half went to producing decks; the deciding itself was the smallest slice.

FY2026 · 1,840 PERSON-HOURS

Stress test — eleven slices, long-tail distribution, none of it on the roadmap.

- Signal Intake engineering 28%
- Scoring policy work 16%
- Decision Log integration 13%
- Per-team calibration 11%
- Explaining the framework to stakeholders 9%
- Pilot and team support 7%
- Documentation and gallery 5%

When NOT to reach for piechart.

Slices that don't sum to a whole. A pie of unrelated metrics is meaningless — the visual implies parts of a whole. If your values are independent measures, use stats or a bar chart instead.

Two slices. A two-slice pie is just a percentage with extra steps. Use big-number or split-panel metric — the audience can read '38% / 62%' faster than they can decode a half-and-half disc.

Comparing two pies. Side-by-side pies force the audience to compare wedge angles across two figures — humans are bad at this. Use grouped bars or a slope chart to land the comparison cleanly.

RELATED COMPONENTS

See also.

- `progress` — comparable parts but precise differences matter
- `stats` — the values are independent metrics, not a partition
- `big-number` — the headline is one slice, not the breakdown
- `kpi` — the slices need status framing and targets
