

Six radar charts, one source contract.

Native SVG radar. Series-major Markdown. Auto-fitting scale. No Mermaid, no charting library.

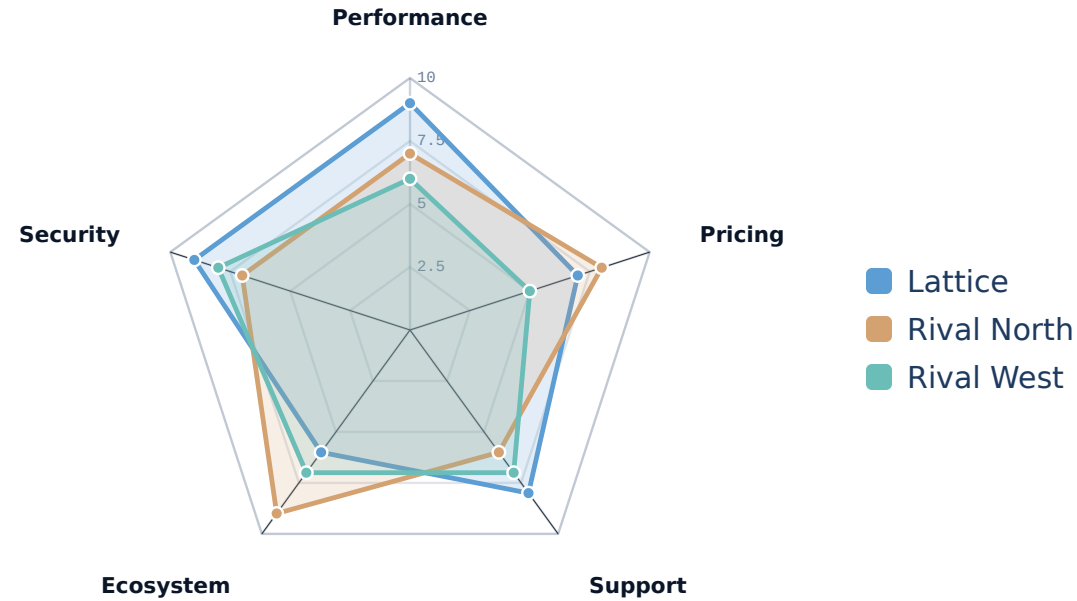

What this deck shows.

A radar chart authored as a plain nested list — each top-level item is a series, each nested item is an `axis` with a trailing `value`.

`lib/radar.js` parses the list, resolves the value scale (auto-fit to the data, or pinned by the eyebrow), and emits a positioned SVG at build time. One default plus five modifiers — `target`, `delta`, `benchmark`, `quadrant`, `small-multiples` — each answering a distinct boardroom question. `minimal` and `dark` compose on top of any of them. Palette-blind, deterministic, zero client-side JavaScript.

SCALE · 0-10

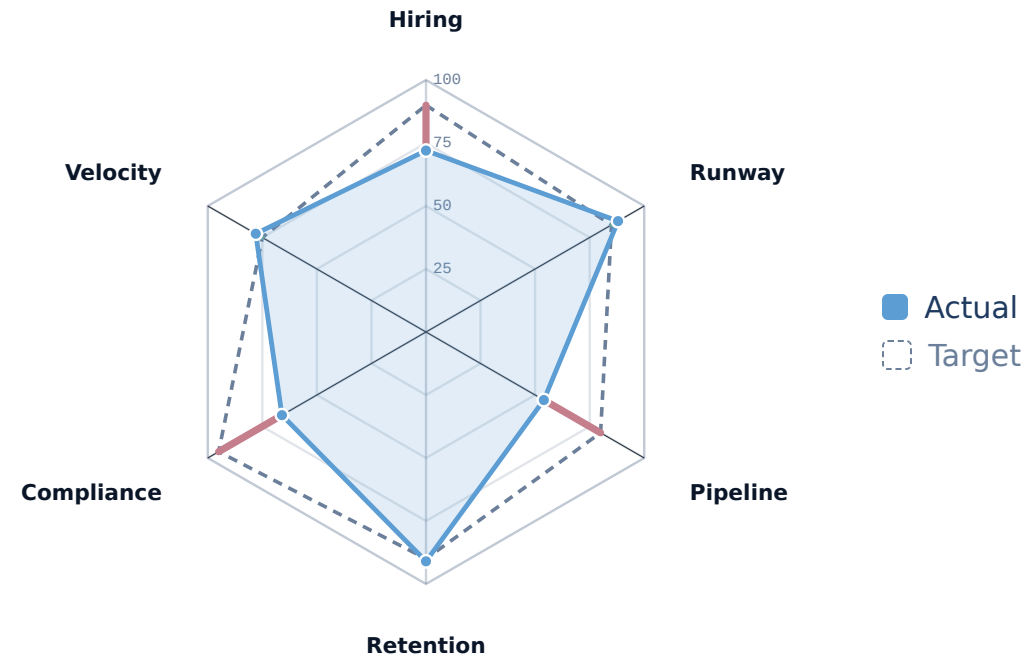

How we stack up across the buying criteria.

The default variant overlays every series as a translucent filled polygon, colour-cycled through the categorical palette. The first series fixes the axis order; the rest align by axis label. Use it to compare two or three profiles at a glance – beyond three, reach for `small-multiples`.

SCALE · 0-100

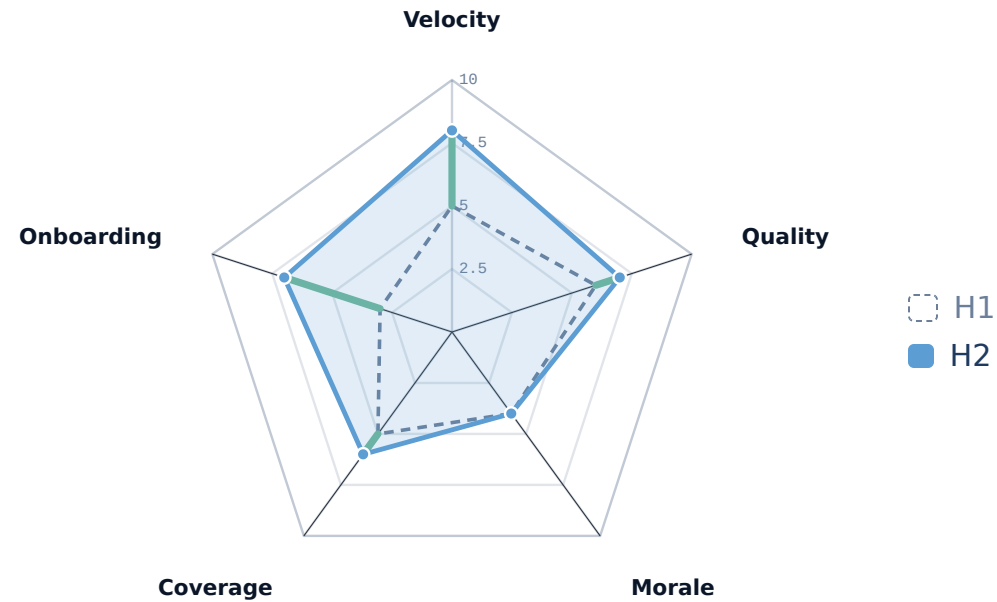

Where we are against the quarter plan.

The `target` variant reads the series named `Target` (or `Goal` / `Plan`) as a dashed reference polygon. Every axis where the actual falls short gets a rose gap segment along the spoke; where it clears the bar, a quiet green one. The shortfall is the read – no eyeballing required.

SCALE · 0-10

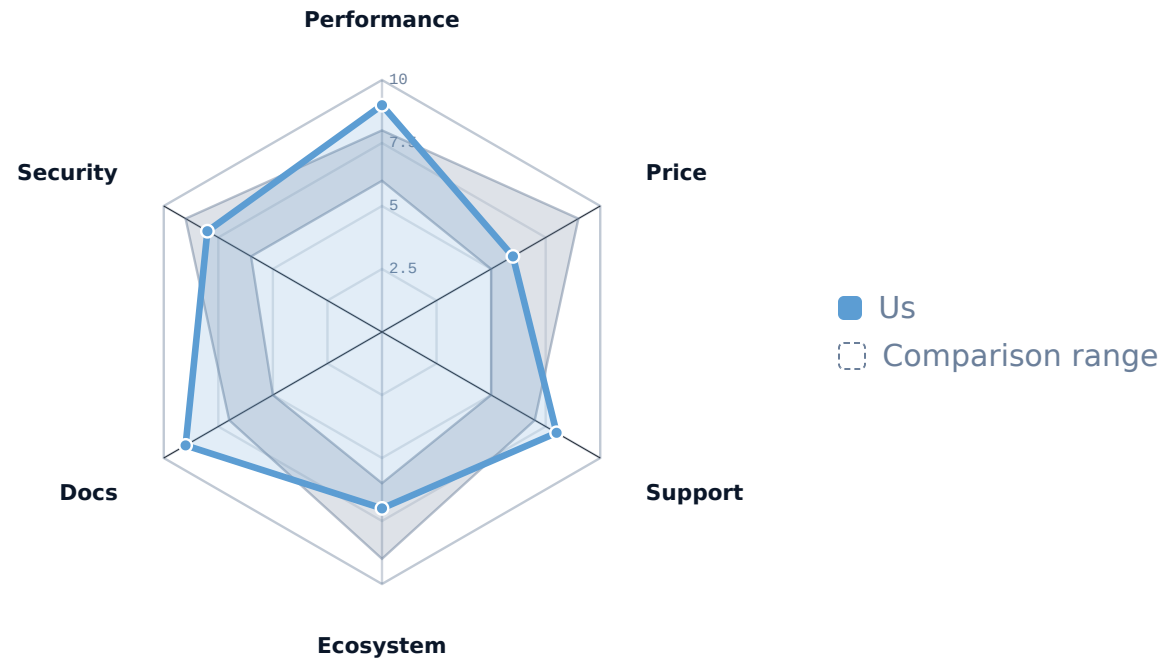

What moved over the half, and which way.

The `delta` variant takes exactly two series – before, then after. The before polygon is drawn muted; a change segment rides each spoke, green where the metric rose, rose where it fell, faint where it held. Built for the period-over-period story in a QBR.

SCALE · 0-10

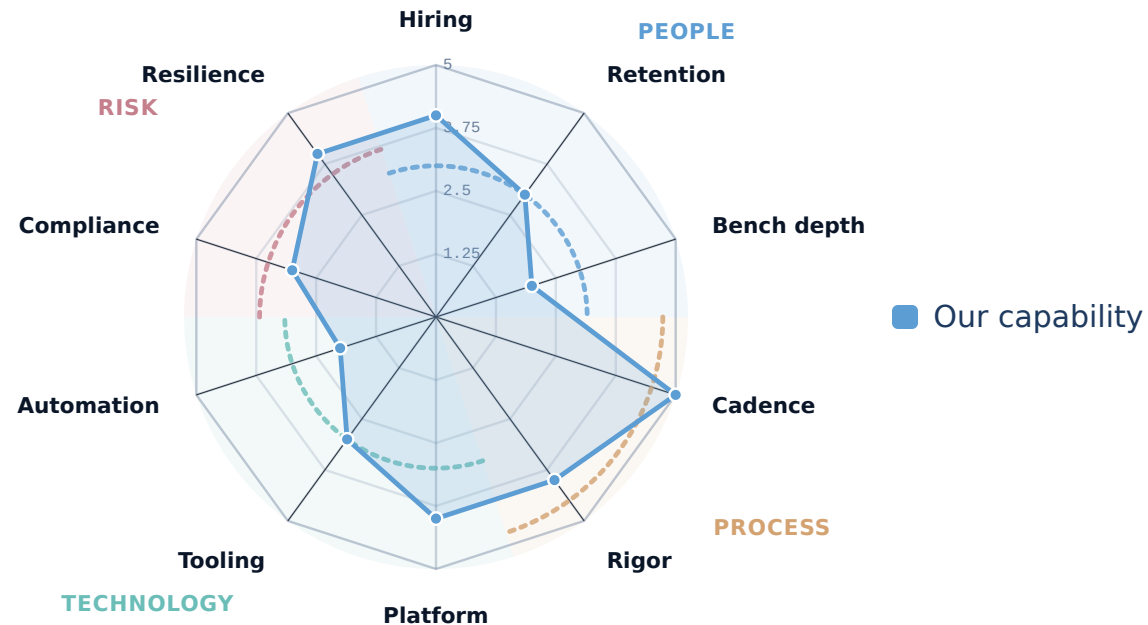

Are we inside the pack, or outside it.

The `benchmark` variant draws the first series as the hero line and collapses every other series into a single min-max envelope band. Instead of five tangled polygons, you get one shape and your line – strong where you clear the band, exposed where you sit inside it.

SCALE · 0-5

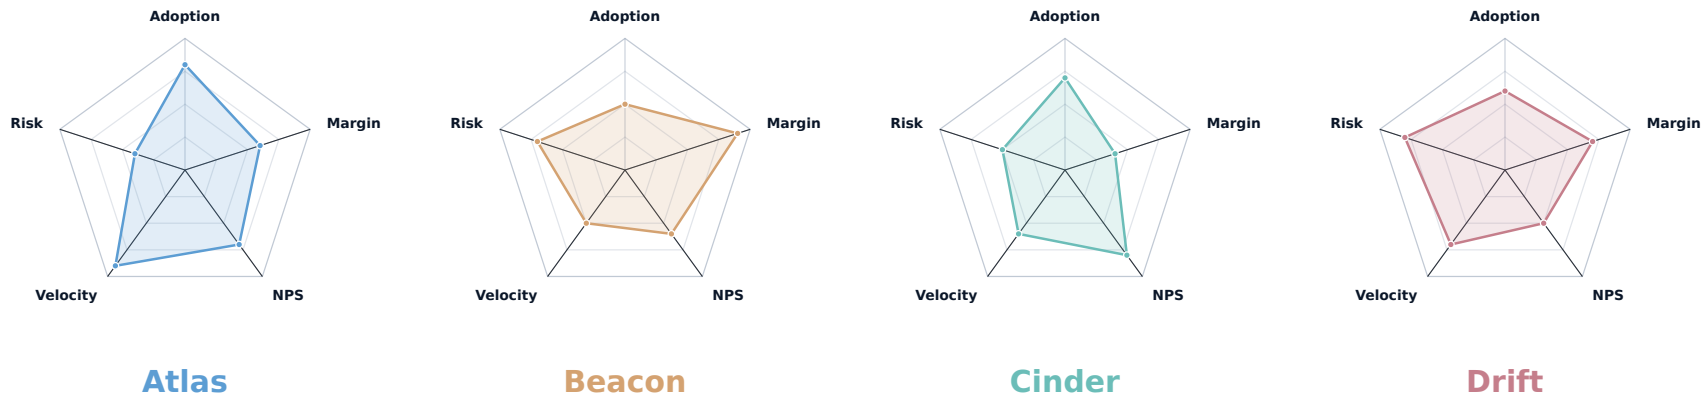

Our capability profile, read by theme.

The `quadrant` variant takes a three-level list – series, then group, then axis. Each group becomes a tinted sector with its name on the rim and a dashed mean arc marking the theme's average. Boards think in themes, not in twelve loose axes.

SCALE · 0-10

Four product lines, the same five criteria.

The `small-multiples` variant gives each series its own mini radar on a shared scale, laid out in a row. When an overlay would be mush – four or more series – this is the honest read: scan the shapes, spot the outlier.

LATTICE · FEATURE DECK

Inspect, then merge.

One default and five modifiers. One Markdown source contract.

Palette-blind, deterministic, zero dependencies.
