

FEATURE DEMO • DEBUG OVERLAY

See the boxes your layout is made of.

Set `debug: on` in the front matter and every preview — Playground, Drawing Board, Studio — outlines each box by its **layout mode** and labels the structural ones. It travels with the deck, and it is **stripped from every export**, so a boardroom PDF is byte-identical whether debug is on or off.

Read the grid at a glance.

The overlay colors each box by how it lays its children out — **grid** (blue), **flex** (vermillion), **flow** (gray) — and labels the slide, every grid/flex container, and each grid cell with `identity · layout · size`.

Tool A · Chorus

-  Speed
-  Auditability
-  Adoption
-  Calibration

Strong call recording and summarization. No decision logging or calibration loop.

Tool B · Productboard

-  Speed
-  Auditability
-  Adoption
-  Calibration

Solid intake and prioritization. Decision logging is manual and rarely used.

Tool C · Notion

-  Speed
-  Auditability
-  Adoption
-  Calibration

Flexible enough to build the whole system — but the result is fragile to maintain.

Tool D · Sprig + Decision Log

-  Speed
-  Auditability
-  Adoption
-  Calibration

Meets all four criteria within the weekly budget. Recommended.

Pull every lever on one slide.

`<!-- _debug: all -->` turns on the full set — `identity · layout · size · class · box` — for **this slide only**. The deck-wide `debug: on` stays the default everywhere else; a spot directive just overrides the box it sits on.

Sizes are the **intrinsic** pixel box, read straight off the layout — not the scaled-down thumbnail you see in the filmstrip.

`class` shows the raw CSS classes; `box` shows padding + gap. Both are opt-in, because on a dense slide they are more than you usually want to read.

Mute a slide you have already checked.

`←!— _debug: off →` silences the overlay on one slide even while the deck is debugging — handy once a layout is settled and the boxes are just noise.

Hover any labeled box to **isolate** it: its chip lights up and the rest dim, so even a busy grid stays readable while you inspect one cell.

Debug in the preview. Ship it clean.

`debug: on` is an authoring aid, not a deck style — the engine strips it from the PDF, PPTX, and HTML exports, so it can never end up in front of a board.
