

PROGRESSION · LEDGER · STRUCTURE

list-criteria

Numbered criteria list — each requirement is a row with rationale.

What every component manifest must satisfy.

01

Stable name.

Kebab-case, matching the

`_class`

directive authors type when invoking the component.

02

Function coordinate.

One of seven families per the four-layer model: anchor, statement, inventory, comparison, progression, evidence, imagery.

03

Form coordinate.

One of eleven spatial shapes: bookend, divider, canvas, grid, stack, ledger, panel, matrix, scatter, timeline, split.

04

Substance coordinate.

One of four plugin contracts: prose, structure, series, graph (or mixed for panel-form components).

05

Skeleton plus sample.

Skeleton scaffolds blank slides for the new-slide CLI; sample demonstrates the component substantively for the gallery.

When NOT to reach for list-criteria.

Parallel options, not gates. If the items are alternatives the audience is choosing between, use `cards-grid` or `verdict-grid`. list-criteria is for requirements all of which must hold.

Rationale longer than two lines. Each row is a one-sentence rationale. If a criterion needs a paragraph, lift it to `list-steps` or `split-brief` where the body has room to breathe.

Missing criterion title. The bold lead on each li is what makes the ledger scannable. A naked sentence per row reads as paragraph soup; the bold title is the structure.

See also.

RELATED COMPONENTS

`list-steps` — rows are procedural steps with longer body, not gating criteria

`checklist` — rows carry done/in-flight/planned state markers

`verdict-grid` — options scored against shared criteria

`principles` — tenets or values rather than gates a decision must clear

`list-tabular` — rows carry structured metadata alongside the name and description
