

Five killer word cloud layouts.

A real spiral packer. Multi-hue palette. Continuous weights. Boardroom-ready.

What this deck shows.

Five word-cloud variants from one source contract. Author writes a list of terms with a trailing weight `1 - 5` (continuous floats allowed); a build-time Archimedean spiral packer places each word around the canvas centre, sizes it continuously from the weight, rotates a deterministic share 90°, and cycles colour through six categorical tokens. One default plus four modifiers — `constellation`, `dense`, `spectrum`, `focal` — that each rebind the engine parameters (density, rotation policy, colour mode, size spread). Zero client-side randomness, zero dependencies, palette-blind.

What the team called out in this quarter's retrospective.

Trailing inline-code is the weight tier 1 - 5 (continuous — 4.3 works). A build-time spiral packer places words around the centre on an aspect-biased Archimedean spiral, picks rotation by rank, and rotates colour through six categorical tokens. Top tier always in accent; bottom tier muted. Deterministic across rebuilds.

LAYOUT · WORD-CLOUD CONSTELLATION

The qualities our customers reach for first.

Sparse modifier. The spiral steps wider so words spread further from the centre, the size spread is steeper, and the colour palette tightens to a three-hue trio — accent for the focal tier, supporting mauve for the mid, muted ink for the satellites. Use this when 8–12 words need air to read.

LAYOUT · WORD-CLOUD DENSE

Every signal our buyers used to describe the category last year.

Packed-mosaic modifier. Tighter spiral step, smaller size spread, and the rotation rate doubled so ~30% of mid-weight words sit vertically — that locks the cloud together and fits 25+ terms without spilling. Use this when the breadth of the language matters more than any single word.

How we ranked the rebrand options after the leadership review.

Heat-ramp modifier. Same spiral packer as the default, but colour follows weight via the sequential `--scale-N` ramp instead of categorical rotation — a monochromatic blue cloud where size and saturation both encode importance. Use this when the cloud needs to read as a single coherent signal rather than a multi-hue chorus.

The one word that defines the next twelve months.

Hero treatment. The size spread is dramatic — the top-weight word balloons to display scale while satellites cycle through the categorical palette at mid sizes. The packer's shrink-to-fit kicks in to keep the hero anchored at centre even when its bounding box approaches the canvas edge. Use this when the deck needs a single word to land — a leadership theme, a brand promise, a verdict.

Inspect, then merge.

Five spiral-packed variants. One markdown source contract.

Palette-blind, deterministic, zero dependencies.
