

READER VIEWS · EXPORTED

One Deck, Three Audiences

A deck is written once and read for different jobs. This file is that deck, exported so each reader can pick the view they came for.

THE GAP • BEFORE

A reader view used to stop at the Studio door.

A deck could carry any number of approved views, and none of them could leave as a file. The board pack got the whole deck or nothing.

The workaround was page surgery: render all 52 pages, extract 2, 8 and 48, staple them back. That needs the absolute page numbers of a view's members — the coupling views exist to remove.

How a view is declared.

Views are declared in front matter, in the deck's own registry block.

Membership rides on the slide, so reordering never corrupts it.

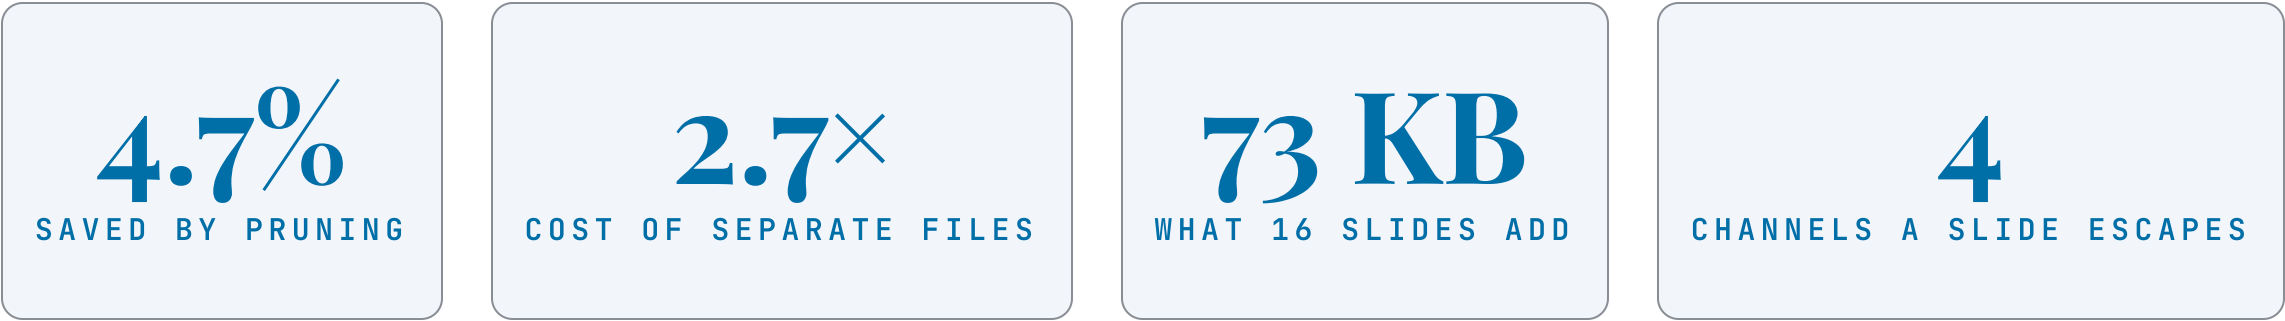

Approval is a person reading that view and saying yes.

The hash covers what the reader sees, so an edit de-approves it.

MEASURED · 16-SLIDE DECK, THREE VIEWS

Pruning saves almost nothing. That was never the point.

Player export, prune applied. The 497 KB scaffold is mostly embedded fonts.

What the export withholds, and what it only hides.

Slides outside the exported views are withheld — absent from every channel.

Slides inside one file are only hidden. Switching is a display rule.

A recipient who must not have a view needs their own file.

An export builds the bytes, so it can leave something out. A viewer cannot.

The re-importable envelope is the one people forget.

A player embeds the deck source so it round-trips into an editable deck — the fourth way a withheld slide reaches a recipient, and the easiest: an import, not a source view.

So a projection carries only what shipped — the views too, not just the slides. `--`

`lens-source full` puts the whole deck back, views and all.

Two commands.

01 One view, as many pages as it projects — pass its id to `--lens`.

02 Two views in one file — pass both ids, and add `--player`.

03 Pick which one it opens on with `--lens-default`.

04 An unavailable view exits non-zero and writes nothing.

WHERE THIS LEAVES US

The artifact now behaves the way the Studio does.
