

2 COMPONENTS

imagery

Imagery — visuals that carry their own meaning.

Applying the criteria, here is where the evidence points.

Self-contained component folders.

One folder per component holding manifest, styles, transform (if needed), example, and README. Matches the pattern every mature design system uses, and lets the scaffolder, bundler, and docs generator read a single source of truth.

Bundler concatenates CSS at build time.

Per-component sources combine into the shipped lattice stylesheet via the build-css tool. Committed bundle with a CI gate.

Manifests are the single source of truth.

Scaffolder, snippets, this gallery, and docs all read from the same JSON.

Tests stay scoped.

One test file per component under the components test path, runnable as a scoped npm script.

Image right is the default — text leads, evidence follows.

The image fills its half-canvas slot edge-to-edge. A 1px hairline marks the join between text and image — boardroom polish, no placeholder pattern visible behind a real photo. Replace the bg image directive with your own asset.
