

INVENTORY · STACK · STRUCTURE

cards-wide

Three or four wide rows, each a full-width card.

When the items want full-width rows.

1 Each item has substantial body text

One to two sentences per item, more than a cards-grid card can hold without crowding. The row layout gives the body room to breathe.

2 The slide scans top-to-bottom

Reading order is sequential rather than parallel. The audience absorbs one row at a time rather than the whole set at a glance.

3 Three or four rows feels right

Beyond four rows the slide gets dense. For more items prefer list-tabular; for fewer items with shorter body prefer cards-stack.

When NOT to reach for cards-wide.

Five or more rows. The slide tips into wall-of-text past four rows. Move to list-tabular for reference density, or split across two cards-wide slides.

One-line rows. If each row is a short phrase the wide cards look padded. Drop to `list` or `tldr` and let the short text speak for itself.

Comparison framing. cards-wide is parallel inventory, not comparison. If the rows are weighed against shared criteria, use compare-table or verdict-grid.

RELATED COMPONENTS

- `cards-stack` — two or three rows with shorter body per card
- `cards-grid` — four or fewer parallel items in a scannable grid
- `list-tabular` — five or more reference-style rows
- `list-steps` — rows carry an explicit, ordered sequence
