

EVIDENCE · CANVAS · GRAPH

diagram

Mermaid diagram as the slide's centerpiece.

How a Lattice slide goes from markdown to PDF.

When NOT to reach for diagram.

Tabular data on axes. Quantitative datapoints across two axes are not flowchart material. Use quadrant, radar, progress, piechart, or timeline-list — the series-substance components are designed for plotted data.

Twenty-node spaghetti. Past a dozen nodes the diagram stops being scannable. Split into two slides, hide leaf nodes behind a summary node, or move to a multi-page diagram-doc reference.

Inline color overrides. Hand-set node colors break the theme contract. Let palette tokens drive everything; if you need to highlight one node, use mermaid's `class` mechanism so the highlight survives theme remapping.

See also.

RELATED COMPONENTS

- `code` — the implementation, not the topology, is the argument
- `quadrant` — items positioned by two numeric attributes
- `radar` — options rated across several criteria
- `timeline-list` — the graph is a sequence in time, not a topology
- `content` — the diagram is one element in a prose slide
