

EVIDENCE · SPATIAL · SERIES

map

A world-countries (or US-states) basemap that fills regions by value (choropleth) or category (highlight) so the audience leaves knowing where.

Where our programs reached — unevenly.

India	48.2
Nigeria	36.4
Kenya	31.0
Brazil	27.5
Indonesia	19.3
Ethiopia	14.1
Bangladesh	11.8
Peru	9.6

Grant dollars by state — unevenly.

The regions we serve.

- Kenya East Africa
- Nigeria West Africa
- India South Asia
- Brazil Latin America

Where our field offices operate.

Coverage by economic bloc.

GROUPS	
European Union	Tier 1
ASEAN	Tier 1
Sub-Saharan Africa	Tier 2
Latin America	Tier 2

A wide spread across fifteen states.

Where our programs reached — unevenly.

India	48.2
Nigeria	36.4
Kenya	31.0
Brazil	27.5
Indonesia	19.3
Ethiopia	14.1
Bangladesh	11.8
Peru	9.6

Ethiopia	14.1
Bangladesh	11.8
Peru	9.6

When NOT to reach for map.

- A map as decoration.** If the regions aren't the comparison — you just want a US-shaped graphic behind some numbers — drop the basemap. An `image` scrim or a `stats` row carries headline figures without implying the geography is the message.
- Too many shades to read.** A choropleth past a dozen distinct values asks the eye to rank colours it can't separate. Bucket the values, switch to `highlight` for a categorical read, or lead with a `progress` ranking and keep the map as support.
- Sub-region precision the basemap doesn't have.** The basemaps draw US states and world countries — not counties, districts, sub-national regions, or city pins, and the world cut (110m) omits the smallest city-states. If the story `image` of the real map serves better than forcing it onto the basemap.

RELATED COMPONENTS

See also.

`progress` — the regions are really a ranking — labelled bars compare magnitudes faster than shades

`stats` — a few headline figures with no geography to place them on

`piechart` — regional shares of a single whole rather than a value per place

`image` — the geography needs detail (counties, cities, routes) the basemap can't draw
