

FEATURE DEMO · COLOUR-VISION DEFICIENCY

Meaning that survives colour blindness.

One front-matter line — `accessibility: deuteranopia` — and the deck stops
relying on hue alone. Status reads by **shape**, categories by **texture**.

THE PROBLEM

~8% of men can't separate your categories by colour.

Under deuteranopia, red↔green collapse; the pale categorical fills a deck
leans on drop to **one or two** distinguishable colours. A palette can't fix
that — the information has to ride a second channel.

Status — colour and glyph and label.

Shape carries what colour can't.

 glyphs prefix every status pill, and each categorical slot gets a distinct **texture** — diagonal, dots, grid, chevron, rings, checker — so a timeline or pie reads in pure greyscale, or to any colour-blind viewer.

A texture per categorical slot.

On a timeline, journey, kanban, or pie, every category fill carries its colour **and** a distinct pattern — diagonal, dots, grid, chevron, rings, checker. Read the deck in greyscale, or hand it to a colour-blind viewer, and the categories still pull apart. (Diagram textures render in the full engine; this demo shows the status-pill channel.)

FOUR TYPES · ONE SWITCH

Deuteranopia · protanopia · tritanopia · achromatopsia.

*Set it on the deck so it travels, or force it in
the workspace so the viewer
who needs it always gets it. Accessibility
takes precedence, always.*
