

FINISH · THE SKETCH MODIFIER

A boardroom deck, drawn by hand.

The `sketch` finish swaps Lattice into a hand-drawn skin — felt-tip headings, a legible hand-sans for body, and boxes that read as sketched. It is palette-blind, so any theme colours it; here it rides the `carta` paper-and-ink palette.

HOW IT WORKS

Form, not colour.

Turn it on once with `class: sketch` in the front matter and it propagates to every slide. Every stroke is drawn in a palette token, so swapping `theme: carta` for `theme: indaco` recolours the whole sketch in blue without touching a layout.

WHY IT READS AS HAND-MADE

Three moves do the work.

Handwriting

Caveat carries the headings;
Shantell Sans keeps body prose
legible across a dense slide.

Drawn boxes

An asymmetric corner radius
plus an offset ink stroke turns
each card into a sketched
rectangle.

A human tilt

Every other card rotates a
fraction of a degree, so the grid
reads placed-by-hand, not
stamped.

THE FINISH TRAVELS

It is not tied to one layout.

Palette-blind by contract

Colours resolve through `var(--token)`, so the finish never assumes a hue — it inherits the active theme's.

PDF-safe by design

The look is pure type and border geometry; no SVG filters, which collapse Marp's print scaling.

Opt body back to clean

Add `sketch-clean-body` to keep the hand headings and boxes while prose returns to the crisp engine face.

CHARTS UNDER SKETCH

The frame is drawn; the data is exact.

Because the finish is CSS and fonts, it reskins the heading and the HTML legend — but a chart's SVG wedges keep their own precise geometry, so the numbers never wobble.

FINISH · SKETCH

Sketched, but still boardroom.

*Pair `sketch` with `carta` for paper-and-ink,
or with any palette for the same hand on
a different page.*
