

COMPARISON · SPLIT · STRUCTURE

before-after

Explicit state-change comparison — what was, what is.

What the manifest refactor produced.

BEFORE.

35 layouts scattered across one 10,382-line lattice.css monolith. Per-layout rules grepped, not folder-located. No central metadata.

AFTER.

45 components self-contained at lib/components, one folder each with manifest plus styles plus example plus README. Bundler concatenates per-component CSS; loader exposes the catalog via JSON.

When NOT to reach for before-after.

split-compare

Two competing options.

Use
when both sides are alternatives under
consideration. before-after is for a change
that already happened.

or

list-steps

More than two states.

If there to show the progression. before-after is binary
is a by construction.
middle
state or
a
sequence
of
changes,
use

Editorial labels on the cards.

The card label is always Before or After. Renaming them to Old way / New way defeats the universal grammar and breaks reader expectations.
