

FEATURE DEMO · COLOUR-VISION DEFICIENCY

# Meaning that survives colour blindness.

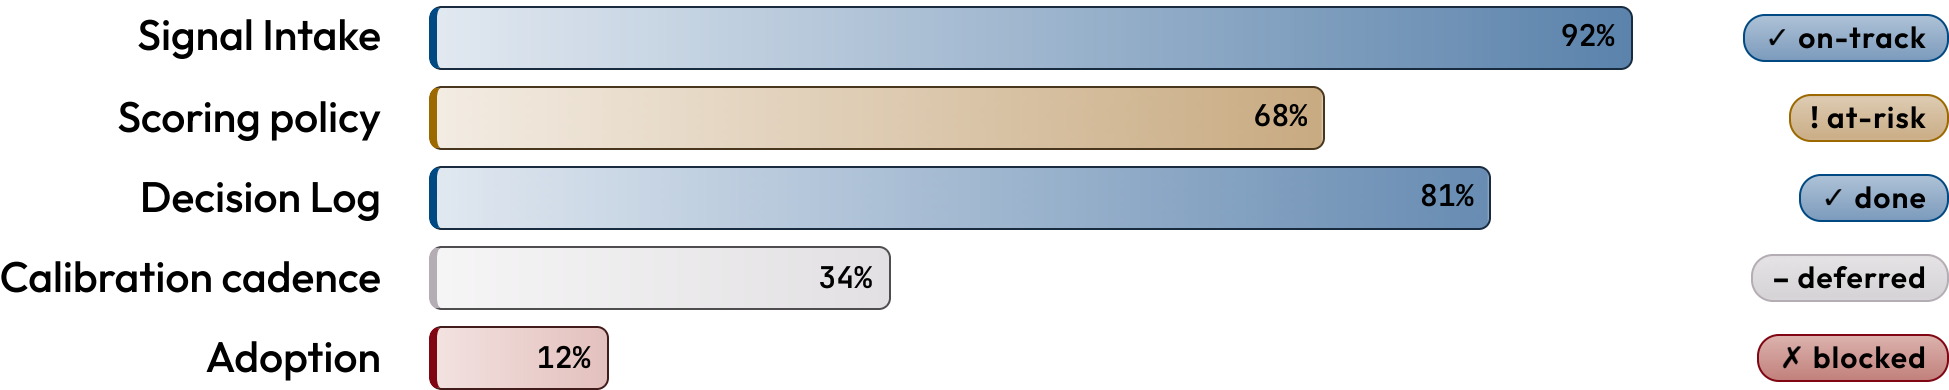

One front-matter line — `accessibility: deuteranopia` — and the deck stops  
relying on hue alone. Status reads by shape, categories by texture.

## THE PROBLEM

**~8% of men can't separate your categories by colour.**

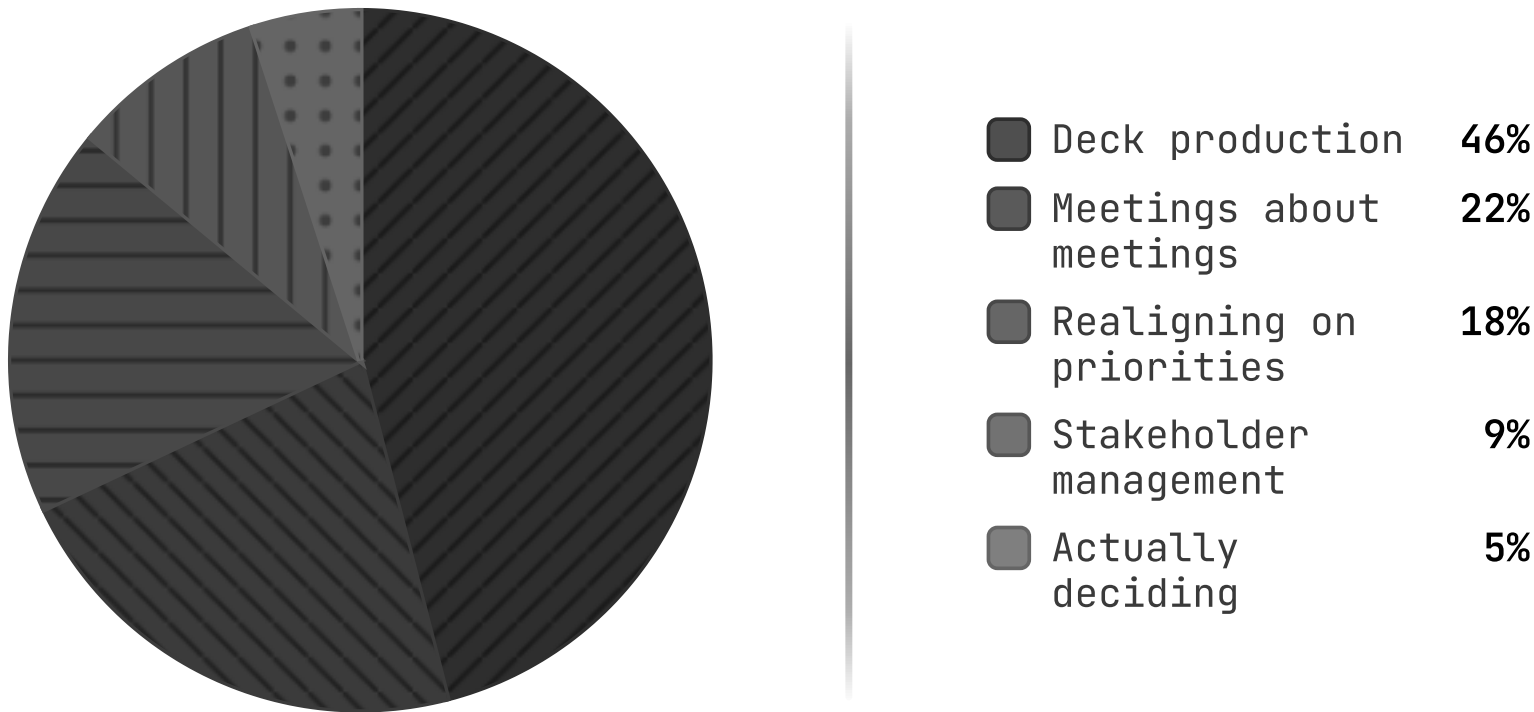

Under deuteranopia, red↔green collapse; the pale categorical fills a deck  
leans on drop to one or two distinguishable colours. A palette can't fix  
that — the information has to ride a second channel.

# Status — colour, glyph, and label.

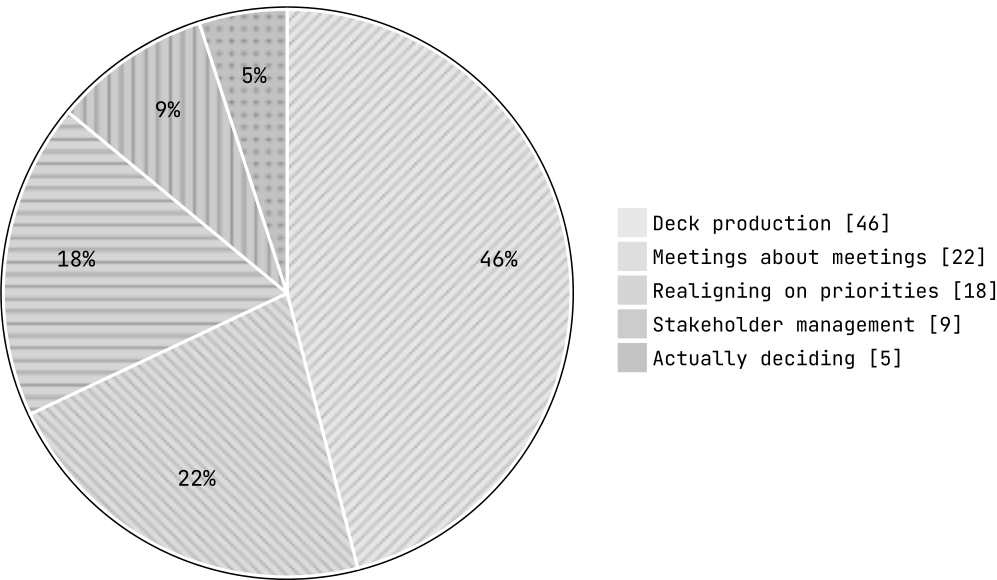

WHERE THE QUARTER WENT

# Wedges read by value and texture.

THE SAME DATA · MERMAID'S OWN PIE

Diagrams texture too — not just native charts.

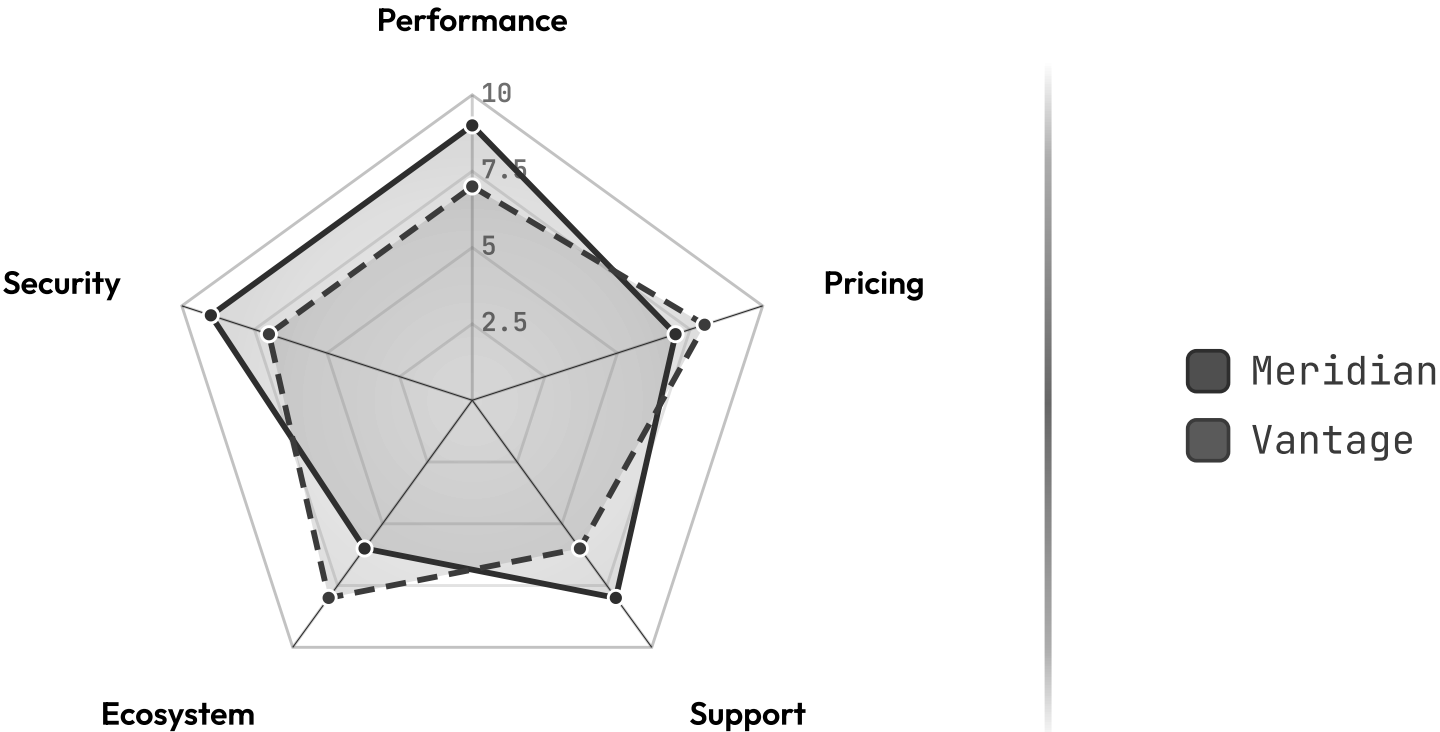

KEY INSIGHT

Each Mermaid slice carries the texture of its colour slot, so the wedges stay separable when hue collapses — on screen and in black-and-white print.

SCALE · 0-10

# Series read by line style.

FOUR TYPES • ONE SWITCH

# Deuteranopia • protanopia • tritanopia • achromatopsia.

*Set it on the deck so it travels, or pick it  
from the Drawing Board's  
Accessibility group. Accessibility takes  
precedence over the theme, always.*
