# map

A US-states or world-countries basemap that fills regions by value (choropleth) or category (highlight) so the audience leaves knowing where.

# Grant dollars reached every region — unevenly.

# The four regions we serve.

# Where our field offices operate.

|               |    |
|---------------|----|
| United States | 42 |
| India         | 38 |
| Brazil        | 31 |
| Nigeria       | 27 |
| Kenya         | 24 |
| Germany       | 22 |
| Indonesia     | 19 |
| Australia     | 12 |

# Coverage by economic bloc.

| GROUPS                                                                              |                    |        |
|-------------------------------------------------------------------------------------|--------------------|--------|
|  | European Union     | Tier 1 |
|  | ASEAN              | Tier 1 |
|  | Sub-Saharan Africa | Tier 2 |
|  | Latin America      | Tier 2 |

# A wide spread across fifteen states.

# Grant dollars reached every region — unevenly.

# Grant dollars reached every region — unevenly.

# Grant dollars reached every region — unevenly.

## When NOT to reach for map.

### A map as decoration.

If the regions aren't the comparison — you just want a US-shaped graphic behind some numbers — drop the basemap. An

image

scrim  
or a

stats

row carries headline figures without implying the geography is the message.

### Too many shades to read Sub-region precision the basemap doesn't have.

A choropleth past a dozen distinct values asks the eye to rank colours it can't separate. Bucket the values, switch to

highlight

for a categorical read, or lead with a

progress

ranking and keep the map as support.

### precision the basemap doesn't have.

The basemaps draw US states and world countries — not counties, districts, sub-national regions, or city pins, and the world cut (110m) omits the smallest city-states. If the story lives below that line, a labelled

image

of the real map serves better than forcing it onto the basemap.

#### RELATED COMPONENTS

## See also.

- `progress` — the regions are really a ranking — labelled bars compare magnitudes faster than shades
- `stats` — a few headline figures with no geography to place them on
- `piechart` — regional shares of a single whole rather than a value per place
- `image` — the geography needs detail (counties, cities, routes) the states basemap can't draw
