

EVIDENCE · SPATIAL · SERIES

map

A US-states or world-countries basemap that fills regions by value (choropleth) or category (highlight) so the audience leaves knowing where.

Grant dollars reached every region — unevenly.

The four regions we serve.

Where our field offices operate.

United States	42
India	38
Brazil	31
Nigeria	27
Kenya	24
Germany	22
Indonesia	19
Australia	12

Coverage by economic bloc.

A wide spread across fifteen states.

Grant dollars reached every region — unevenly.

Grant dollars reached every region — unevenly.

Grant dollars reached every region — unevenly.

When NOT to reach for map.

A map as decoration.

If the regions aren't the comparison — you just want a US-shaped graphic behind some numbers — drop the basemap. An

image

scrim
or a

stats

row carries headline figures without implying the geography is the message.

Too many shades to read Sub-region

A choropleth past a dozen distinct values asks the eye to rank colours it can't separate. Bucket the values, switch to

highlight

for a categorical read, or lead with a

progress

ranking and keep the map as support.

precision the basemap doesn't have.

The basemaps draw US states and world countries — not counties, districts, sub-national regions, or city pins, and the world cut (110m) omits the smallest city-states. If the story lives below that line, a labelled

image

of the real map serves better than forcing it onto the basemap.

RELATED COMPONENTS

See also.

- `progress` — the regions are really a ranking — labelled bars compare magnitudes faster than shades
- `stats` — a few headline figures with no geography to place them on
- `piechart` — regional shares of a single whole rather than a value per place
- `image` — the geography needs detail (counties, cities, routes) the states basemap can't draw
