

2 COMPONENTS

progression

Progression — ordered movement through stages or time.

What a vendor must clear before procurement signs.

01

SOC 2 Type II

A current report with no exceptions in the security or availability criteria.

02

Data residency

Customer data stays in-region; every sub-processor is disclosed and contractually bound.

03

Exit guarantee

Full data export in a documented format, available without opening a support ticket.

04

Breach notification

A 72-hour notice obligation written into the contract, not the marketing page.

05

Uptime history

Twelve months of published status at 99.9% or better, verifiable independently.

What happens in the first hour of an incident, in theory.

STEP 01

Declare and page

Whoever notices opens the incident channel and pages on-call. Declaring is cheap; a missed page is the line item in the post-mortem.

STEP 02

Assign a commander

One person owns coordination and communication. They direct the response — they do not debug it, though they will be asked why they aren't.

STEP 03

Stop the bleeding

Mitigate before diagnosing. Roll back, fail over, or shed load first; find the root cause once customers are safe and the board has logged off.

STEP 04

Communicate on a clock

A status update every 30 minutes, even when it is "still investigating." Silence is what the retrospective remembers.
