What this branch named, by weight.

A word cloud visualization where the size of each word corresponds to its frequency. The words are arranged in a horizontal, slightly overlapping manner. The word 'component' is the largest and most central. Other prominent words include 'function', 'substance', 'form', and 'manifest'. Smaller words like 'variant', 'universal', and 'gallery' are also visible.

When NOT to reach for word-cloud.

Precise comparisons.

If the audience needs to know that 'manifest' is 1.6× 'function', the spiral packing actively misleads. Use

or a bar chart where the eye can compare lengths directly.

Two or three words.

A three-word cloud is a list with extra steps. Use

stats for a metric row or big-number for a single weighted headline.

Multi-word phrases.

Each li should be a single token. Multi-word phrases blow out the layout and crowd the spiral; if your data is phrases, normalise to keywords first or use

for verbatim text.

RELATED COMPONENTS

See also.

- `progress` — the weights need precise visual comparison
- `stats` — the headline metrics are independent numbers, not a corpus
- `piechart` — the items are parts of a whole, not free-form themes
- `quote` — the verbatim language matters more than the frequency
- `list` — single-line takeaways — the `takeaway` variant
